

Fair temporal gate and onset support

Counts are delivery-target rows from the completed p1_s3_fair_v1 manifest; no row is an independent inferential unit.

(a) Disjoint artifact-building phases

Fit-only normalization/model/bank | selection-only lambda and head checkpoint, then alpha | calibration-only threshold | held-out scoring

(b) Positive onset counts by phase

Zero selection and calibration positives at every cap and lag force the declared onset-selection/threshold fallbacks.
