

Benchmark gate, analysis units, and onset support

All counts and rules are frozen in p1_ieee_access_upgrade_v2; delivery targets are not independent replicates.

A | Horizon-offset temporal gate

Target embargoes have length h at 4380, 5256, and 6132; each downstream query endpoint $s=t-h$ has crossed its boundary.

Fit: normalization, model parameters, and retrieval bank | Selection: checkpoint/hyperparameters | Calibration: threshold | Test: score once

B | Target counts

Lag	Fit	Select	Calibrate	Test
1 h	4332	875	875	2627
24 h	4309	852	852	2604

C | Positive onset support

Lag	Selection	Calibration	Test
1 h	0	0	57
24 h	0	0	172

Onset-targeted selection is inapplicable; test metrics remain diagnostic.
